All glazes shown on this chart have been fired in an electric kiln under oxidation and have been applied to a white clay body. Variations from the illustrated colour may occur depending upon the colour of the base clay, thickness, thinness or irregularity of application, firing temperature and kiln atmosphere. We recommend trialling all glazes under your specific studio conditions. All glazes are available in either powder or brush-on form. It is advisable to add glaze antiset to powdered glaze when mixing with water. This will help prevent settling of heavy glaze ingredients. Glazes should be kept in labelled lidded containers.
